Chapter 1

Triangle

Consider a triangle with vertices

$$\mathbf{A} = \begin{pmatrix} -3 \\ -5 \end{pmatrix}, \mathbf{B} = \begin{pmatrix} 3 \\ -5 \end{pmatrix}, \mathbf{c} = \begin{pmatrix} -4 \\ -3 \end{pmatrix}, \tag{1.1}$$

1.1. Vectors

1.1.1. The direction vector of AB is defined as

$$\mathbf{B} - \mathbf{A} \tag{1.1.1.1}$$

Consider a triangle with vertices

$$\mathbf{A} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} \tag{1.1.1.2}$$

$$\mathbf{B} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} \tag{1.1.1.3}$$

$$\mathbf{C} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} \tag{1.1.1.4}$$

The Direction Vector of AB is defined as

$$\mathbf{B} - \mathbf{A} \tag{1.1.1.5}$$

Question1.1.1 :Find the Direction Vectors of AB,BC,CA.

Solution:

(a) The Direction vector of AB is

$$= \mathbf{B} - \mathbf{A} \tag{1.1.1.6}$$

$$= \begin{pmatrix} 3 - (-3) \\ -5 - (-5) \end{pmatrix} \tag{1.1.1.7}$$

$$= \begin{pmatrix} 6 \\ 0 \end{pmatrix} \tag{1.1.1.8}$$

2

(b) The Direction vector of BC

$$= \mathbf{C} - \mathbf{B} \tag{1.1.1.9}$$

$$= \begin{pmatrix} -4 - (3) \\ -3 - (-5) \end{pmatrix} \tag{1.1.1.10}$$

$$= \begin{pmatrix} -7 \\ 2 \end{pmatrix} \tag{1.1.1.11}$$

(c) The Direction vector of CA

$$= \mathbf{A} - \mathbf{C} \tag{1.1.1.12}$$

$$= \begin{pmatrix} -3 - (-4) \\ -5 - (-3) \end{pmatrix} \tag{1.1.1.13}$$

$$= \begin{pmatrix} 1 \\ -2 \end{pmatrix} \tag{1.1.1.14}$$

1.1.2. The length of side BC is

$$\|\mathbf{B} - \mathbf{A}\| \triangleq \sqrt{(\mathbf{B} - \mathbf{A})^\top \mathbf{B} - \mathbf{A}} \tag{1.1.2.1}$$

where

$$\mathbf{A}^\top \triangleq \begin{pmatrix} -3 & -5 \end{pmatrix} \tag{1.1.2.2}$$

Question 1.1.2 : Find the length of side AB, BC, CA.

3

Solution: Solving for BC Given,

$$\mathbf{A} = \begin{pmatrix} -3 \\ -5 \end{pmatrix}, \mathbf{B} = \begin{pmatrix} 3 \\ -5 \end{pmatrix}, \mathbf{C} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} \tag{1.1.2.3}$$

$$\|\mathbf{B} - \mathbf{C}\| = \sqrt{(\mathbf{B} - \mathbf{C})^\top (\mathbf{B} - \mathbf{C})} \tag{1.1.2.4}$$

$$\mathbf{B} - \mathbf{C} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} - \begin{pmatrix} -4 \\ -3 \end{pmatrix} \tag{1.1.2.5}$$

$$\mathbf{B} - \mathbf{C} = \begin{pmatrix} 7 \\ -2 \end{pmatrix} \tag{1.1.2.6}$$

$$(\mathbf{B} - \mathbf{C})^\top = \begin{pmatrix} 7 \\ -2 \end{pmatrix}^\top = \begin{pmatrix} 7 & -2 \end{pmatrix} \tag{1.1.2.7}$$

$$(\mathbf{B} - \mathbf{C})^\top (\mathbf{B} - \mathbf{C}) = \begin{pmatrix} 7 & -2 \end{pmatrix} \begin{pmatrix} 7 \\ -2 \end{pmatrix} \tag{1.1.2.8}$$

$$= 49 + 4 \tag{1.1.2.9}$$

$$= 53 \tag{1.1.2.10}$$

$$\sqrt{(\mathbf{B} - \mathbf{C})^\top (\mathbf{B} - \mathbf{C})} = \sqrt{53} \tag{1.1.2.11}$$

$$\implies \|\mathbf{B} - \mathbf{C}\| = \sqrt{53} \tag{1.1.2.12}$$

Solving for AB Given,

$$\|\mathbf{A} - \mathbf{B}\| = \sqrt{(\mathbf{A} - \mathbf{B})^\top (\mathbf{A} - \mathbf{B})} \qquad (1.1.2.13)$$

$$\mathbf{A} - \mathbf{B} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} - \begin{pmatrix} 3 \\ -5 \end{pmatrix} \qquad (1.1.2.14)$$

$$\mathbf{A} - \mathbf{B} = \begin{pmatrix} -6 \\ 0 \end{pmatrix} \qquad (1.1.2.15)$$

$$(\mathbf{A} - \mathbf{B})^\top = \begin{pmatrix} -6 \\ 0 \end{pmatrix}^\top = \begin{pmatrix} -6 & -0 \end{pmatrix} \qquad (1.1.2.16)$$

$$(\mathbf{A} - \mathbf{B})^\top (\mathbf{A} - \mathbf{B}) = \begin{pmatrix} -6 & 0 \end{pmatrix} \begin{pmatrix} -6 \\ 0 \end{pmatrix} \qquad (1.1.2.17)$$

$$= 36 + 0 \qquad (1.1.2.18)$$

$$= 36 \qquad (1.1.2.19)$$

$$\sqrt{(\mathbf{A} - \mathbf{B})^\top (\mathbf{A} - \mathbf{B})} = \sqrt{36} \qquad (1.1.2.20)$$

$$\implies \|\mathbf{A} - \mathbf{B}\| = \sqrt{36} \qquad (1.1.2.21)$$

Solving for CA Given,

$$\|\mathbf{C} - \mathbf{A}\| = \sqrt{(\mathbf{C} - \mathbf{A})^\top (\mathbf{C} - \mathbf{A})} \qquad (1.1.2.22)$$

$$\mathbf{C} - \mathbf{A} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} - \begin{pmatrix} -3 \\ -5 \end{pmatrix} \qquad (1.1.2.23)$$

$$\mathbf{C} - \mathbf{A} = \begin{pmatrix} -1 \\ 2 \end{pmatrix} \qquad (1.1.2.24)$$

$$(\mathbf{C} - \mathbf{A})^\top = \begin{pmatrix} -1 \\ 2 \end{pmatrix}^\top = \begin{pmatrix} -1 & 2 \end{pmatrix} \qquad (1.1.2.25)$$

$$(\mathbf{C} - \mathbf{A})^\top (\mathbf{C} - \mathbf{A}) = \begin{pmatrix} -1 & 2 \end{pmatrix} \begin{pmatrix} -1 \\ 2 \end{pmatrix} \qquad (1.1.2.26)$$

$$= 1 + 4 \qquad (1.1.2.27)$$

$$= 5 \qquad (1.1.2.28)$$

$$\sqrt{(\mathbf{C} - \mathbf{A})^\top (\mathbf{C} - \mathbf{A})} = \sqrt{5} \qquad (1.1.2.29)$$

$$\implies \|\mathbf{C} - \mathbf{A}\| = \sqrt{5} \qquad (1.1.2.30)$$

1.1.3. Points $\mathbf{A}, \mathbf{B}, \mathbf{C}$ are defined to be collinear if

$$\text{rank} \begin{pmatrix} 1 & 1 & 1 \\ \mathbf{A} & \mathbf{B} & \mathbf{C} \end{pmatrix} = 2 \qquad (1.1.3.1)$$

Are the given points in (**??**) collinear?

Question 1.1.3 : Check the collinearity of $\mathbf{A}, \mathbf{B}, \mathbf{C}$

6

Solution: Given that,

$$\mathbf{A} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} \quad \mathbf{B} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} \quad \mathbf{C} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} \tag{1.1.3.2}$$

Given that $\mathbf{A}, \mathbf{B}, \mathbf{C}$ are collinear if

$$\text{rank} \begin{pmatrix} 1 & 1 & 1 \\ \mathbf{A} & \mathbf{B} & \mathbf{C} \end{pmatrix} < 3 \tag{1.1.3.3}$$

Let

$$\mathbf{R} = \begin{pmatrix} 1 & 1 & 1 \\ -3 & 3 & -4 \\ -5 & -5 & -3 \end{pmatrix} \tag{1.1.3.4}$$

The matrix $\mathbf{R}$ can be row reduced as follows,

$$\begin{pmatrix} 1 & 1 & 1 \\ -3 & 3 & -4 \\ -5 & -5 & -3 \end{pmatrix} \xleftarrow{R_3 \leftarrow R_3 + 5R_1} \begin{pmatrix} 1 & 1 & 1 \\ -3 & 3 & -4 \\ 0 & 0 & 2 \end{pmatrix} \tag{1.1.3.5}$$

$$\xleftarrow{R_2 \leftarrow R_2 + 3R_1} \begin{pmatrix} 1 & 1 & 1 \\ 0 & 6 & -1 \\ 0 & 0 & 2 \end{pmatrix} \tag{1.1.3.6}$$

There are no zero rows. So,

$$\text{rank} \begin{pmatrix} 1 & 1 & 1 \\ \mathbf{A} & \mathbf{B} & \mathbf{C} \end{pmatrix} = 3 \qquad (1.1.3.7)$$

Hence, from (**??**) the points $\mathbf{A}, \mathbf{B}, \mathbf{C}$ are not collinear.

From Fig. **??**, We can see that $\mathbf{A}, \mathbf{B}, \mathbf{C}$ are not collinear .

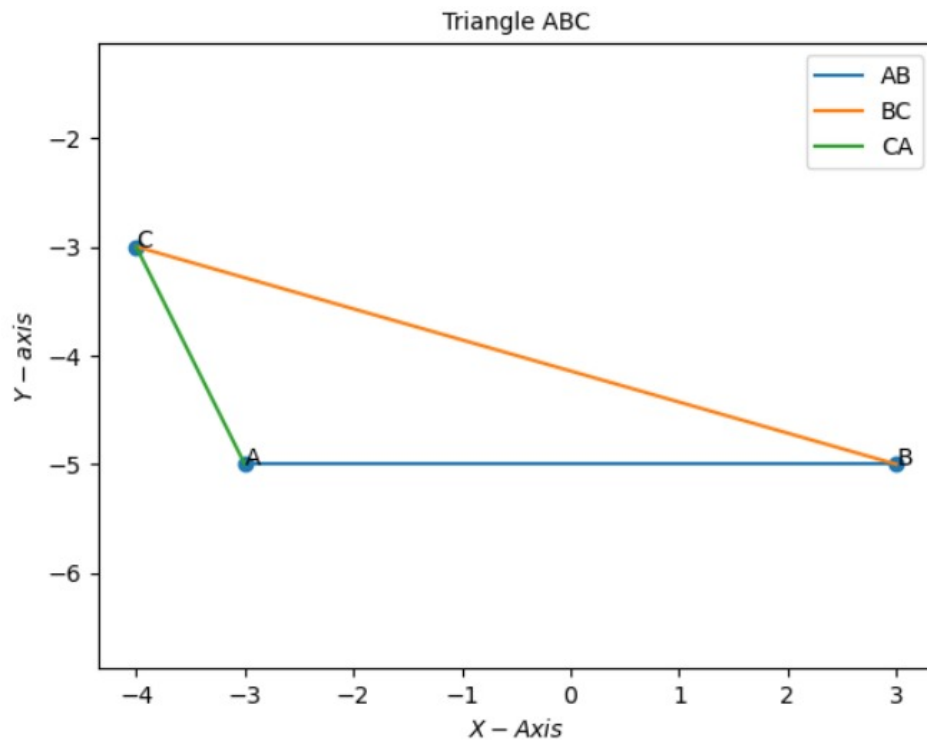

Figure 1.1: $\mathbf{A}, \mathbf{B}, \mathbf{C}$ plot

1.1.4. The parameteric form of the equation of AB is

$$\mathbf{x} = \mathbf{A} + k\mathbf{m} \qquad (1.1.4.1)$$

where

$$\mathbf{m} = \mathbf{B} - \mathbf{A} \qquad\qquad (1.1.4.2)$$

is the direction vector of AB.

Question 1.1.4 :Find the parametric equation of AB,BC,CA.

Solution: The parametric equation for AB is given by

$$\mathbf{x} = \mathbf{A} + k\mathbf{m} \qquad\qquad (1.1.4.3)$$

$$\text{where, } \mathbf{m} = \mathbf{B} - \mathbf{A} \qquad\qquad (1.1.4.4)$$

$$= \begin{pmatrix} 3 \\ -5 \end{pmatrix} - \begin{pmatrix} -3 \\ -5 \end{pmatrix} \qquad\qquad (1.1.4.5)$$

$$= \begin{pmatrix} 6 \\ 0 \end{pmatrix} \qquad\qquad (1.1.4.6)$$

Hence we get,

$$AB : \mathbf{x} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} + k \begin{pmatrix} 6 \\ 0 \end{pmatrix} \qquad\qquad (1.1.4.7)$$

Similarly,

$$BC : \mathbf{x} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} + k \begin{pmatrix} -7 \\ 2 \end{pmatrix} \tag{1.1.4.8}$$

$$CA : \mathbf{x} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} + k \begin{pmatrix} 1 \\ -2 \end{pmatrix} \tag{1.1.4.9}$$

1.1.5. The normal form of the equation of AB is

$$\mathbf{n}^\top (\mathbf{x} - \mathbf{A}) = 0 \tag{1.1.5.1}$$

where

$$\mathbf{n}^\top \mathbf{m} = \mathbf{n}^\top (\mathbf{B} - \mathbf{A}) = 0 \tag{1.1.5.2}$$

$$\text{or, } \mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \mathbf{m} \tag{1.1.5.3}$$

$$\mathbf{n}^\top \left(\mathbf{x} - \mathbf{A} \right) = 0 \tag{1.1.5.4}$$

where

$$\mathbf{n}^\top \mathbf{m} = \mathbf{n}^\top \left(\mathbf{B} - \mathbf{A} \right) = 0 \tag{1.1.5.5}$$

10

or,

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \mathbf{m} \tag{1.1.5.6}$$

Question 1.1.5:Find the normal form of the equations of AB, BC and CA.

Solution: : The normal equation for the side AB is

$$\mathbf{n}^\top \left(\mathbf{x} - \mathbf{A} \right) = 0 \tag{1.1.5.7}$$

$$\implies \mathbf{n}^\top \mathbf{x} = \mathbf{n}^\top \mathbf{A} \tag{1.1.5.8}$$

Now our task is to find the $\mathbf{n}$ so that we can find $\mathbf{n}^\top$. As given in the question

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \mathbf{m} \tag{1.1.5.9}$$

Here $\mathbf{m} = \mathbf{B} - \mathbf{A}$ for side $\mathbf{AB}$

$$\implies \mathbf{m} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} - \begin{pmatrix} -3 \\ -5 \end{pmatrix} \tag{1.1.5.10}$$

$$= \begin{pmatrix} 6 \\ 0 \end{pmatrix} \tag{1.1.5.11}$$

Now as we have obtained vector $\mathbf{m}$. we can use this to obtain vector $\mathbf{n}$

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \begin{pmatrix} 6 \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ -6 \end{pmatrix} \tag{1.1.5.12}$$

The transpose of $\mathbf{n}$ is

$$\mathbf{n}^\top = \begin{pmatrix} 0 & -6 \end{pmatrix} \tag{1.1.5.13}$$

Hence the normal equation of side AB is

$$\begin{pmatrix} 0 & -6 \end{pmatrix} \mathbf{x} = \begin{pmatrix} 0 & -6 \end{pmatrix} \begin{pmatrix} -3 \\ -5 \end{pmatrix} \tag{1.1.5.14}$$

$$\implies \begin{pmatrix} 0 & -6 \end{pmatrix} \mathbf{x} = 30 \tag{1.1.5.15}$$

The normal equation for the side BC is

$$\mathbf{n}^\top \left(\mathbf{x} - \mathbf{B} \right) = 0 \tag{1.1.5.16}$$

$$\implies \mathbf{n}^\top \mathbf{x} = \mathbf{n}^\top \mathbf{B} \tag{1.1.5.17}$$

Now our task is to find the $\mathbf{n}$ so that we can find $\mathbf{n}^\top$. As given in the question

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \mathbf{m} \tag{1.1.5.18}$$

12

Figure 1.2: The line **AB** plotted using python

Here $\mathbf{m} = \mathbf{C} - \mathbf{B}$ for side $\mathbf{BC}$

$$\implies \mathbf{m} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} - \begin{pmatrix} 3 \\ -5 \end{pmatrix} \qquad (1.1.5.19)$$

$$= \begin{pmatrix} -7 \\ 2 \end{pmatrix} \qquad (1.1.5.20)$$

Now as we have obtained vector $\mathbf{m}$. we can use this to obtain vector $\mathbf{n}$

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \begin{pmatrix} -7 \\ 2 \end{pmatrix} = \begin{pmatrix} 2 \\ 7 \end{pmatrix} \qquad (1.1.5.21)$$

The transpose of $\mathbf{n}$ is

$$\mathbf{n}^\top = \begin{pmatrix} 2 & 7 \end{pmatrix} \qquad (1.1.5.22)$$

Hence the normal equation of side BC is

$$\begin{pmatrix} 2 & 7 \end{pmatrix} \mathbf{x} = \begin{pmatrix} 2 & 7 \end{pmatrix} \begin{pmatrix} 3 \\ -5 \end{pmatrix} \qquad (1.1.5.23)$$

$$\implies \begin{pmatrix} 2 & 7 \end{pmatrix} \mathbf{x} = -29 \qquad (1.1.5.24)$$

Figure 1.3: The line **BC** plotted using python

The normal equation for the side CA is

$$\mathbf{n}^\top \left(\mathbf{x} - \mathbf{C}\right) = 0 \qquad (1.1.5.25)$$

$$\implies \mathbf{n}^\top \mathbf{x} = \mathbf{n}^\top \mathbf{C} \qquad (1.1.5.26)$$

Now our task is to find the $\mathbf{n}$ so that we can find $\mathbf{n}^\top$. As given in the question

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \mathbf{m} \qquad (1.1.5.27)$$

Here $\mathbf{m} = \mathbf{A} - \mathbf{C}$ for side $\mathbf{CA}$

$$\implies \mathbf{m} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} - \begin{pmatrix} -4 \\ -3 \end{pmatrix} \qquad (1.1.5.28)$$

$$= \begin{pmatrix} 1 \\ -2 \end{pmatrix} \qquad (1.1.5.29)$$

Now as we have obtained vector $\mathbf{m}$. we can use this to obtain vector $\mathbf{n}$

$$\mathbf{n} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ -2 \end{pmatrix} = \begin{pmatrix} -2 \\ -1 \end{pmatrix} \qquad (1.1.5.30)$$

The transpose of $\mathbf{n}$ is

$$\mathbf{n}^\top = \begin{pmatrix} -2 & -1 \end{pmatrix} \qquad (1.1.5.31)$$

16

Figure 1.4: The line **CA** plotted using python

Hence the normal equation of side CA is

$$\begin{pmatrix} -2 & -1 \end{pmatrix} \mathbf{x} = \begin{pmatrix} -2 & -1 \end{pmatrix} \begin{pmatrix} -4 \\ -3 \end{pmatrix} \qquad (1.1.5.32)$$

$$\implies \begin{pmatrix} -2 & -1 \end{pmatrix} \mathbf{x} = 11 \qquad (1.1.5.33)$$

1.1.6. The area of $\triangle ABC$ is defined as

$$\frac{1}{2} \left\| (\mathbf{A} - \mathbf{B}) \times \mathbf{A} - \mathbf{C} \right\| \qquad (1.1.6.1)$$

17

where

$$\mathbf{A} \times \mathbf{B} \triangleq \begin{vmatrix} 1 & -4 \\ -1 & 6 \end{vmatrix} \tag{1.1.6.2}$$

Question 1.1.6:Find the area of $\triangle$ ABC.

Solution: Given,

$$\mathbf{A} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} ; \mathbf{B} = \begin{pmatrix} 3 \\ -5 \end{pmatrix} ; \mathbf{C} = \begin{pmatrix} -4 \\ -3 \end{pmatrix} \tag{1.1.6.3}$$

$$\mathbf{A} - \mathbf{B} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} - \begin{pmatrix} 3 \\ -5 \end{pmatrix} = \begin{pmatrix} -6 \\ 0 \end{pmatrix} \tag{1.1.6.4}$$

$$\mathbf{A} - \mathbf{C} = \begin{pmatrix} -3 \\ -5 \end{pmatrix} - \begin{pmatrix} -4 \\ -3 \end{pmatrix} = \begin{pmatrix} 1 \\ -2 \end{pmatrix} \tag{1.1.6.5}$$

$$\therefore (\mathbf{A} - \mathbf{B}) \times (\mathbf{A} - \mathbf{C}) = \begin{vmatrix} -6 & 1 \\ 0 & -2 \end{vmatrix} \tag{1.1.6.6}$$

$$= (-6) \times (-2) - 1 \times 0 \tag{1.1.6.7}$$

$$= 12 - 0 \tag{1.1.6.8}$$

$$= 12 \tag{1.1.6.9}$$

$$\implies \frac{1}{2} \|(\mathbf{A} - \mathbf{B}) \times (\mathbf{A} - \mathbf{C})\| = \frac{12}{2} = 6 \tag{1.1.6.10}$$

1.1.7. Question 1.1.7:Find the angles $\mathbf{A}, \mathbf{B}, \mathbf{C}$, given that

$$\cos A \triangleq \frac{(\mathbf{B} - \mathbf{A})\top(\mathbf{C} - \mathbf{A})}{\|\mathbf{B} - \mathbf{A}\| \, \|\mathbf{C} - \mathbf{A}\|} \tag{1.1.7.1}$$

Solution:

From the given values of $\mathbf{A}, \mathbf{B}, \mathbf{C}$,

(a) Finding the value of angle A

$$\mathbf{B} - \mathbf{A} = \begin{pmatrix} 6 \\ 0 \end{pmatrix} \tag{1.1.7.2}$$

and

$$\mathbf{C} - \mathbf{A} = \begin{pmatrix} -1 \\ +2 \end{pmatrix} \tag{1.1.7.3}$$

also calculating the values of norms

$$\|\mathbf{B} - \mathbf{A}\| = \sqrt{36} \qquad = 6 \tag{1.1.7.4}$$

$$\|\mathbf{C} - \mathbf{A}\| = \sqrt{5} \tag{1.1.7.5}$$

19

and by doing matrix multiplication we get,

$$(\mathbf{B} - \mathbf{A})^\top (\mathbf{C} - \mathbf{A}) = \begin{pmatrix} 6 & 0 \end{pmatrix} \begin{pmatrix} -1 \\ +2 \end{pmatrix} \tag{1.1.7.6}$$

$$= -6$$

so

$$\cos A = \frac{-6}{6\sqrt{5}} \tag{1.1.7.7}$$

$$= \frac{-1}{\sqrt{5}} \tag{1.1.7.8}$$

$$\implies A = \cos^{-1} \frac{-1}{\sqrt{5}} \tag{1.1.7.9}$$

(b) Finding the value of angle B

$$\mathbf{C} - \mathbf{B} = \begin{pmatrix} -7 \\ 2 \end{pmatrix} \tag{1.1.7.10}$$

and

$$\mathbf{A} - \mathbf{B} = \begin{pmatrix} -6 \\ 0 \end{pmatrix} \tag{1.1.7.11}$$

also calculating the values of norms

$$\|\mathbf{C} - \mathbf{B}\| = \sqrt{5} \tag{1.1.7.12}$$

$$\|\mathbf{A} - \mathbf{B}\| = \sqrt{53} \tag{1.1.7.13}$$

and by doing matrix multiplication we get,

$$(\mathbf{C} - \mathbf{B})^\top (\mathbf{A} - \mathbf{B}) = \begin{pmatrix} -7 & 2 \end{pmatrix} \begin{pmatrix} -6 \\ 0 \end{pmatrix} \tag{1.1.7.14}$$

$$= 42$$

so

$$\cos B = \frac{42}{\sqrt{36}\sqrt{53}} \tag{1.1.7.15}$$

$$= \frac{7}{\sqrt{53}} \tag{1.1.7.16}$$

$$\implies B = \cos^{-1} \frac{7}{\sqrt{53}} \tag{1.1.7.17}$$

(c) Finding the value of angle C

$$\mathbf{A} - \mathbf{C} = \begin{pmatrix} 1 \\ -2 \end{pmatrix} \tag{1.1.7.18}$$

and

$$\mathbf{B} - \mathbf{C} = \begin{pmatrix} 7 \\ -2 \end{pmatrix} \tag{1.1.7.19}$$

also calculating the values of norms

$$\|\mathbf{A} - \mathbf{C}\| = \sqrt{5} \tag{1.1.7.20}$$

$$\|\mathbf{B} - \mathbf{C}\| = \sqrt{53} \tag{1.1.7.21}$$

21

and by doing matrix multiplication we get,

$$(\mathbf{A} - \mathbf{C})^\top (\mathbf{B} - \mathbf{C}) = \begin{pmatrix} 1 & -2 \end{pmatrix} \begin{pmatrix} 7 \\ -2 \end{pmatrix} \qquad (1.1.7.22)$$

$$= 11$$

so

$$\cos C = \frac{11}{\sqrt{5}\sqrt{53}} \qquad (1.1.7.23)$$

$$= \frac{11}{\sqrt{265}} \qquad (1.1.7.24)$$

$$\implies C = \cos^{-1} \frac{11}{\sqrt{265}} \qquad (1.1.7.25)$$

1.2. Median

1.3. Altitude

1.4. Perpendicular Bisector

1.5. Angle Bisector
